**DETAILED ACTION**

1. This application is in condition for allowance except for the following formal matters:
2. Claim 8 is objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim. Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form.

***Response to Amendment***

3. The amendment received on 8/21/08 has been entered.
4. In view of the amendment received on 8/21/08, the 35 U.S.C. 103 rejection of claims 1-3, 5-14 and 16-18 is withdrawn.

***Allowable Subject Matter***

5. The following is an examiner's statement of reasons for allowance: The present invention is directed to a wireless signal switching circuit for switching a plurality of transmitter and receiver signals having different frequencies. Each independent claim identifies the uniquely distinct features: regarding claim 1, the phase rotating means comprises the inductor having the other end connected to the common input and output terminal of the diplexer, a first capacitor connected between one end of the inductor and a reference potential node, a second capacitor connected between the other end of the inductor and the reference potential node, a first switch means having one end connected to the other end of the inductor, and a third capacitor connected between the

other end of the first switch means and the reference potential node, and has the characteristics that a circuit defined by the inductor and the first to third capacitors imparts a phase rotation of 90 degrees to the phase of the signal of the frequency component supplied to the first signal route switching means when the first switch means is activated and that a circuit defined by the inductor and the first and second capacitors attenuates the harmonic component of the signal transmitted by the second communication system when the first switch means is de-activated. The closest two prior arts, AAPA (applicant's admitted prior art, fig. 1) discloses a first signal route switching means; and a second signal route switching means; Yrjölä et al. (U.S. PATENT NO. 5,521,561) disclose a phase shift PS as disclosed in fig. 6 and an inductor being connected between the one end connected to the antenna terminal, either singularly or in combination, fail to anticipate or render the above features obvious.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
